Abstract

Nursing combines different components of health care including health history, assessment, pathophysiology, diagnostics, nursing diagnoses, patient safety, research, and medical interventions/treatments. Important to all of these components is critical thinking, as critical thinking allows a nurse to promote safety, prioritize disease management, and intervene when necessary. The following document contains case studies or "experiences" from four days in an intensive care unit (ICU) and one day in an emergency department. Each experience is broken down into different components of nursing and is ended with a critical thinking analysis of the experience.

Acknowledgements

I would like to thank my thesis advisor Dr. Debra Siela for her guidance and knowledge as I completed this thesis and my final semester of nursing school. I have never had an instructor so thorough in her lectures, and I cannot express enough how grateful I am for the knowledge she has given me. Her instruction made me fall in love with critical care nursing, and I hope to be as skilled a nurse as she is someday.

I would also like to thank my clinical instructor Jessica Duncan for her weekly support and her constructive feedback on my weekly case studies. I am thankful for the autonomy and confidence she helped instill in me.
